COMPREHENSIVE DETAILED EViews ANALYSIS

The secondary data for analysis was obtained from various sources. These include the Lagos State Bureau of Statistics, the Central Bank of Nigeria, the World Bank, the National Bureau of Statistics. The method of analysis adopted is the multi-regression analysis. The model specification for the analysis is as stated below:

$$GDP = f(ENT, LP, UN, INF)$$

The econometric deduction is stated thus:

$$GDP = \alpha_0 + \beta_1 ENT_{it} + \beta_2 GDP_{it-1} + \beta_3 LP_{it} + \beta_4 UEMP_{it} + \beta_5 INF_{it} + \mu_{it}$$

GDP = Gross domestic product

LP = Labour Productivity

UEMP = Unemployment rate

ENT= Entrepreneurship

GDP_{it-1}= one year lag of the GDP

$\alpha_0,\ \beta_1,\ \beta_2,\ \beta_3\ , \beta_4\ and\ \beta_5$= Regression Coefficients

μ_{it} = Error Term

The researcher adopted the Ordinary least square method of estimation.

A one-year lag of the Gross Domestic product was introduced as an independent variable to correct the autocorrelation problem.

Validation of the research instrument.

The questionnaire used as the research instrument was subjected to face its validation. This research instrument (questionnaire) adopted was adequately checked and validated by the supervisor his contributions and corrections were included into the final draft of the research instrument used.

Reliability of Instrument

Data collected from the respondents were collated, coded and analysed using the Cronbach's Alpha Reliability Test Technique. The decision for the Cronbach's Alpha Reliability test is that if the alpha value is greater than 0.78 (78%) in each of the specific dimension (i.e. the items in the various sections of the instrument), it shows that the instrument is reliable and suitable for the study.

Table 3.1: Summary of the Cronbach's alpha reliability test.

Instruments	No. of Items	Cronbach's alpha value	Remark
Standard of Living	8	0.950	Significant
Entrepreneurship	7		
Productivity	6		
Employment Generation	5		
Literacy Level	5		

***Source**: Field Work, 2023*

Table 3.1 shows the Cronbach's alpha value of the reliability test conducted. The result shows that the test conducted on the different sections and items of the questionnaire returned significant. Specifically, the test score showed alpha value of 0.950 indicating that the items raised is suitable and reliable to test for the subject matter of the study. This implies that the questionnaire measures the influence of entrepreneurship on improving socio-economic living standard of the people.

Dependent Variable: GDP
Method: Least Squares
Date: 06/16/23 Time: 17:29
Sample (adjusted): 2008 2022
Included observations: 15 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-669503.8	377392.0	-1.774028	0.1098
ENTRE	9.860350	4.201393	2.346924	0.0435
LGDP	-5.630135	4.420015	-1.273782	0.2347
PRODTY	130.8415	417.7232	0.313225	0.7612
UNEMP	-401552.7	308384.6	-1.302116	0.2252
INF	1290693.	1226214.	1.052584	0.3200

R-squared	0.489209	Mean dependent var	44476.82
Adjusted R-squared	0.205436	S.D. dependent var	101915.8

Log likelihood	-188.7067	Hannan-Quinn criter.	25.95788
F-statistic	1.723945	Durbin-Watson stat	1.947943
Prob(F-statistic)	0.225014		

source: the Author, using EViews statistical analysis software.

The probability value of the entre is less than 0.05 which shows that it has a positive significant impact on the dependent variable.

Variable: This column lists the independent variables used in the regression analysis. The variables mentioned in this table are C, ENTRE, LGDP, PRODTY, UNEMP, and INF.

The coefficient for the constant term in the regression model is -669,503.8. This means that when all the independent variables in the model are zero, the estimated value of the dependent variable is -669,503.8.

With emphasis on entrepreneurship as proxy by Annual Number of new business startups, the result of the model estimated above showed that entrepreneurship is a significant determinant of economic growth in Lagos State. The coefficient for the variable entrepreneurship, "ENTRE" is 9.860350. This suggests that a one unit increase in the number of new business formation is associated with an estimated increase of approximately 9.860350 units in the Gross Domestic Product. The standardized coefficient indicates that for a one-standard-deviation increase in the entrepreneurship, the Gross domestic product is expected to increase by approximately 1.182818 standard deviations. The elasticity at means value of 14.99835 suggests that a one-percent increase in the Entrepreneurship is associated with an estimated increase of approximately 14.99835 percent in the Gross domestic Product of the State. In addition, the result indicates that ENTRE is statistically significant in explaining economic growth in Lagos state. That is, entrepreneurship is fundamental to achieving economic growth in Lagos state.

The coefficient for the variable "LGDP" is -5.630135. This indicates that a one percent increase in the "LGDP" variable is associated with an estimated decrease of approximately 5.630135 units in the dependent variable.

The coefficient for the variable Labour Productivity "PRODTY" is 130.8415. This suggests that a one unit increase in the "PRODTY" variable is associated with an estimated increase of approximately 130.8415 units in the Gross Domestic Product of the state. Also, the standardized coefficient indicates that for a one-standard-deviation increase in the Labour Productivity, Gross Domestic Product is expected to increase by approximately 0.089388 standard deviations. with the elasticity at means value of 1.667382, a one-percent increase in Labour Productivity is

associated with an estimated increase of approximately 1.667382 percent in the Gross Domestic Product.

The coefficient for Unemployment "UNEMP" is -401,552.7. This indicates that a one unit increase in the rate of unemployment is associated with an estimated decrease of approximately 401,552.7 percent in the Gross Domestic Product of Lagos State. The standardized coefficient indicates that for a one-standard-deviation increase in the unemployment rate, Gross Domestic Product is expected to decrease by approximately 0.548513 standard deviations. The elasticity at means value of -2.057997 suggests that a one-percent increase in the unemployment rate is associated with an estimated decrease of approximately 2.057997 percent in the Gross Domestic Product.

The coefficient for rate of inflation, "INF" is 1,290,693. This suggests that a one-unit increase in the rate of inflation is associated with an estimated increase of approximately 1,290,693 units in the Gross domestic product of the state. The standardized coefficient indicates that for a one-standard-deviation increase in the "INF" variable, the dependent variable is expected to increase by approximately 0.359692 standard deviations. The elasticity at means value of 3.642347 suggests that a one-percent increase in the "INF" variable is associated with an estimated increase of approximately 3.642347 percent in the GDP.

This finding backs up Ebiringa's (2011) assertion that enterprise development is directly related to economic development. As a result, it was suggested that the government and the organized private sector boost funding for programs that provide entrepreneurial/vocational training as a component of the tertiary education system.
